Fruit

In botany, a fruit is the seed-bearing structure in flowering plants (also known as angiosperms) formed from the ovary after flowering.

Fruits are the means by which angiosperms disseminate seeds. Edible fruits, in particular, have propagated with the movements of humans and animals in a symbiotic relationship as a means for seed dispersal and nutrition; in fact, humans and many animals have become dependent on fruits as a source of food. Accordingly, fruits account for a substantial fraction of the world's agricultural output, and some (such as the apple and the pomegranate) have acquired extensive cultural and symbolic meanings.

In common language usage, "fruit" normally means the fleshy seed-associated structures of a plant that are sweet or sour, and edible in the raw state, such as apples, bananas, grapes, lemons, oranges, and strawberries. On the other hand, in botanical usage, "fruit" includes many structures that are not commonly called "fruits", such as bean pods, corn kernels, tomatoes, and wheat grains. The section of a fungus that produces spores is also called a fruiting body.

Groups of Fruit: Simple, Aggregate and Multiple Fruit (With Diagram)

In this article, we propose to discuss the three groups of fruit. They are:

- (1) Simple Fruits
- (2) Aggregate Fruits and
- (3) Multiple or Composite Fruits.

The stimulus of fertilization not only develops ovules into seeds but also brings about other changes in the flower and even in the inflorescence.

Usually, all the parts of the flower except the ovary wither away. The ovary begins to enlarge simultaneously with the development of the seed and ultimately becomes the fruit. These changes usually involve a copious development of succulent parenchyma within the ovary.
